

fn match_group_by_truncation

Michael Shoemate (@Shoeboxam)

May 28, 2026

This proof resides in “**contrib**” because it has not completed the vetting process.

Proves soundness of `match_group_by_truncation` in `mod.rs` at commit `f5bb719` (outdated¹).

39     return true_set, false_set

```

Postcondition

Theorem 1.1 (Postcondition). For a given query plan and user identifier expression, if the query plan bounds row contributions per-identifier via a group-by, returns a triple containing the input to the truncation, the truncation itself, and the per-id bound on user contribution.

Proof. Lines 4-14 check if the query plan is a simple group-by, and exits without a match if not.

A valid group-by truncation is a group-by where the grouping keys contain a user identifier. So line 16 splits the group-by keys into two sets, and line 18 rejects the match if the user identifier is not in the group-by keys.

The remaining grouping columns are then reflected in the bound on user contributions, on line 24. $\square$
